    static async Task Main(string[] args)
    {
        List<string> mockData = new List<string> { "Sensor1: 23.5", "Sensor2: 18.7", "Sensor3: 21.0" };

        Console.WriteLine("Simulating Data Ingestion...");

        foreach (var data in mockData)
        {
            await Task.Delay(500);
            Console.WriteLine($"Data Sent: {data}");
        }

        Console.WriteLine("Data Ingestion Simulation Complete.");

        Console.WriteLine("Processing Data...");
        var processedData = mockData.Select(d => $"Processed {d}");

        foreach (var data in processedData)
        {
            await Task.Delay(500);
            Console.WriteLine(data);
        }

        Console.WriteLine("Data Processing Simulation Complete.");
    }
}
```

```
C:\Windows\system32\cmd.exe
Simulating Data Ingestion...
Data Sent: Sensor1: 23.5
Data Sent: Sensor2: 18.7
Data Sent: Sensor3: 21.0
Data Ingestion Simulation Complete.
Processing Data...
Processed Sensor1: 23.5
Processed Sensor2: 18.7
Processed Sensor3: 21.0
Data Processing Simulation Complete.
Press any key to continue . . .
```

What are Azure Event Hubs and how do they work?

An Azure Event Hub is a real-time service that allows you to process a huge number of events per second. An event in this regard are pieces of information or data that represent something that happened in a system. An example of an event is a user login. Event hubs allow you to collect a lot of data from various applications and store it in one place.
